

AI BUILD CHALLENGE — BENGALURU

INDUSTRY PROBLEM STATEMENT

Presented by Masters' Union Ventures | Powered by Hackingly

18 September 2026 · Startup Park, Koramangala, Bengaluru

PS-003 · HACKINGLY PLATFORM TRACK

AI-Powered Identity & Eligibility Verification for Hackathon Registrations

INDUSTRY PARTNER: HACKINGLY

THE CHALLENGE

Hackingly runs registration for hackathons and competitions, many of which are age-restricted, student-only, or require proof of identity — an Aadhaar card, a college ID, a government ID. Verifying this manually doesn't scale. An existing OCR pipeline built on AWS Textract extracts a date of birth from an uploaded ID image to auto-check age eligibility, but it stops there: it cannot tell a genuine document from a fake or edited one, catch the same ID being reused across multiple registrations under different names, or confirm the person registering is who the document says. The challenge is to build a system that can automatically and reliably verify that a participant is who they say they are, and eligible for the event they're registering for, from nothing but a photo of their ID.

YOUR MISSION

Build an AI-powered solution that addresses this problem and demonstrates a clear, practical use case.

- ▶ Extend the existing OCR-based verification pipeline into a full identity and eligibility verification system
- ▶ Return an eligibility decision with a confidence score and a human-readable reason for each registration
- ▶ Minimize false positives so legitimate participants are not blocked by overly strict checks

WHO IS THE USER?

Primary User: Hackathon organizers running Hackingly's registration flow, and the participants they need to verify

Context: Many events are age-restricted, student-only, or ID-gated, and manually verifying Aadhaar, college ID, PAN, and similar documents doesn't scale.

WHAT COULD YOUR SOLUTION DO?

- ▶ Extract name, date of birth, ID number/type, and institution across common Indian ID documents
- ▶ Flag likely fake, tampered, blurry, or duplicate documents — including the same ID reused under different names
- ▶ Cross-check an extracted photo/name against the registration form and verify a face match where a selfie is provided
- ▶ Plug directly into Hackingly's existing registration flow with minimal changes to the current OCR pipeline

These are starting points, not limitations. Teams are encouraged to think beyond the suggested directions.

KEY CONSIDERATIONS

- ▶ Must build on top of the existing AWS Textract-based DOB-extraction pipeline
- ▶ Needs to catch tampering and duplicate or reused IDs, not just extract fields
- ▶ False positives must be minimized so legitimate participants aren't blocked
- ▶ Anonymized sample ID images are available on request

Resources / APIs / Data: Existing AWS Textract-based DOB-extraction pipeline; anonymized sample ID images provided on request

BUILD EXPECTATIONS

IDEA → BUILD → ITERATE → TEST → SHIP

You can start building as soon as the problem statement is shared. Come to the venue with approximately 80% of your solution ready. The final product must be built, tested and completed at the venue during the AI Build Challenge.

FINAL EVALUATION: 100% WEIGHTAGE | WORKING PROTOTYPE REQUIRED

Problem Understanding & Relevance • Solution Quality & Problem-Solution Fit • Execution & Working Prototype • Innovation / Use of AI • Feasibility & Potential Impact

Don't just talk about AI. Build with it.
